The Burmester Team

About this Device

The 217 is the new record player for Burmester's popular Top Line. Inspired by the Burmester Reference Line's multi-award-winning 175, the 217 also largely eschews technological aids in favour of top playback quality, and is easy and intuitive to operate. During the development and production of the device, Burmester called upon its more than 35 years of experience in building equipment with top-level phono signals, capitalising on this expertise to offer a wider range of products in this field.

THE HIGHLIGHTS:

BELT DRIVE FOR LOW-RESONANCE

The 217 is equipped with two belt drive motors, which enable near-perfect turntable running due to their high-precision bearings, belts and controls. In combination with the massive, low-resonance unibody housing made of solid aluminium, this enables exceptionally precise and exquisite playback of vinyl records.

HIGH-QUALITY MATERIALS FOR OPTIMUM SOUND PICKUP

Burmester's 217 record player builds on its big brother, the 175. On the straight tone arm tube, which is made of a unidirectional carbon fibre compound (fibre-reinforced composite) sits a precisely milled and offset aluminium headshell. The length between the fulcrum and the tip of the stylus tip is 239.1 mm – resulting in just over 9 inches of tone arm. The tone arm is gimbal-mounted. Each 217 comes with a turntable mat made of composite leather.

→ Once the record player is in position, turn its feet by hand until it is completely horizontal.

REMOVING THE TRANSPORT SAFETY EQUIPMENT FOR THE DRIVE

The 217 is supplied with the belts and pulley pre-fitted. In order to protect the bearing, the pulley is secured using two retaining screws during transport.

Remove the retaining screws before placing the turntable on the device.

NOTE:
Keep the retaining screws in a safe place in case you need to transport the device again in the future.

CONNECTING THE TONE ARM CABLE

Carefully plug the angled plug on the enclosed tone arm cable into the socket (9) just under the tone arm.

Make sure the angled end of the plug is pointing backwards.

Earth conductor with spade lug

Connect the tone arm cable’s earth conductor to the spade lug on the earth connection on your preamplifier or amplifier. Observe the operation manual for your amplifier while doing so.

NOTE:

If your amplifier does not have XLR inputs, you can use adapters or a high-quality tone arm with other connectors.

Before playing a record, remove the stylus protector from the pickup system (14) by carefully pulling it downwards.

→ Keep the stylus protector in a safe place and put it back on the record player when it is not in use.

RAISING AND LOWERING THE TONE ARM

1. If necessary, undo the tone arm retainer (12).

RAISING THE TONE ARM

Move the cue control lever (13) back.
→ The tone arm will raise.

LOWERING THE TONE ARM

Move the cue control lever (13) forwards.
→ The tone arm will lower.

NOTE:

In order to avoid damaging the stylus, do not lower the tone arm unless there is a record on the turntable.

Adjusting the Tone Arm

SETTING THE ANTI-SKATING MECHANISM

In its delivery state, the 217's tone arm will be pre-calibrated and should not need any further adjustment.

If required, you can set the anti-skating mechanism to compensate for the forces exerted by the tone arm. This will ensure you can enjoy the perfect sound experience. If you want to check or adjust the anti-skating mechanism, the easiest way to do this is using the Burmester Reference Check record available from your dealer.

NOTE:

Make sure you switch off your music system for the duration of the adjustment work!

TO ADJUST THE ANTI-SKATING MECHANISM USING THE BURMESTER REFERENCE CHECK RECORD, PLEASE PROCEED AS FOLLOWS:

1. Place the Burmester Reference Check record on the turntable with Side A facing upwards, and switch on the record player using the POWER switch (5).
→ The record will start to spin.
2. Set the speed adjustment switch (1) to 45.
3. If necessary, undo the tone arm's transport retainer (12).
4. Raise the tone arm using the cue control lever.
5. Move the tone arm to the centre of the open space on the test record.
6. Lower the tone arm using the cue control lever (13).
→ The pickup must maintain its position on the test record without drifting either inwards or outwards.

If the pickup does not maintain its position:

7. Slowly turn the anti-skating adjustment mechanism (11) clockwise.
8. If the drifting becomes more pronounced, turn the adjustment mechanism back in the opposite direction.
9. Turn the adjustment mechanism in the required direction until the pickup maintains its position.

NOTE:

Setting the anti-skating mechanism up in a way that allows the tone arm to drift outwards slightly may improve the sound of your system.

ADJUSTING THE CONTACT WEIGHT

The contact weight (10) of the tone arm is already set up for the enclosed Burmester MC pickup system, and does not require further adjustment. It is fixed in place using grub screws to prevent it from being adjusted accidentally.

If you have any questions regarding adjusting your tone arm, please contact your dealer.
