## FEATURES

### 1. Low mass type tonearm improves trackability and fidelity.

The head shell is integrated into the arm tube, with its a connector portion located at the base of the tube. The construction materials for this tonearm have been selected very carefully to reduce the effective mass to the bare minimum. As a result, even when mated with a high compliance cartridge, the low end resonance frequency ( $f_0$ ) does not become too low but remains optimum. Clearer sound is achieved since the effects of record warpage and rotational eccentricity are eliminated along with intermodulation distortion.

Since a straight shaped tonearm is almost symmetrical from side to side, dimensional or mechanical accuracies are improved. This design eliminates dimensional error or torsional distortion, making higher fidelity reproduction possible.

### 2. Replaceable S-shaped arm tube with standard 4P connector.

By replacing the low mass arm tube with the S-shape arm tube, the virtually all head shells or integrated cartridges/head shells can be utilized on the DP-60L. By having the ability to use the widest selection of cartridges, your audio enjoyment will be significantly broadened.

### 3. Magnetic recording speed detection system.

The turntable platter speed of the DP-60L is detected by DENON's magnetic recording detection system. The detection frequency is high enough (1000 pulses per rotation) to allow ultra fast response of the servo loop. Overshoot and wow and flutter are virtually eliminated.

### 4. Auto-lift mechanism with non-contact record-end sensor.

The automatic arm lift (auto-lift) mechanism functions in such a way that when a record playback is finished, the tonearm is automatically lifted and the platter rotation stops. This eliminates the possibility of stylus wear by leaving it tracking the lead out record grooves. At the end of play, a non-contact record-end sensor senses the velocity change of the tonearm with an opto-electronic transducer, eliminating unnecessary load on the record or stylus. Sound quality is totally unaffected by this system.

### 5. Angular control motor lifts tonearm.

The arm lifting device employs a servo-controlled angular control motor developed by DENON, for ultra-smooth and silent up and down motion.

### 6. PLL servo control via a quartz crystal oscillator guarantees speed accuracy of below 0.002%, and is almost totally immune to variation of temperature, humidity, load condition or supply voltage fluctuation.

### 7. The combination of Bi-directional servo control and electronic braking, together with rotational detection offers the quickest, smoothest start, stop and speed change-over.

### 8. Counterweight shaft is damped effectively to suppress partial resonance of tonearm body.

### 9. The turntable mat was developed through vibration analysis through laser holography.

## NAMES OF PARTS AND FUNCTION

### ① Power switch

The power is turned on when the switch is pressed in (—). The lamps in the stop button and in the strobe viewing window will light. When pressed again (⬇), the power is turned off and lamps also turn off. If the power switch is turned on (—) while the arm lifter is down, the arm lifter will lift.

### ② Start buttons

Press

33 for a 33-1/3 rpm record, and  
45 for a 45 rpm. record.

When one of the buttons is pressed, the lamp in the button lights and the platter starts rotation. Simultaneously, the arm lifter lowers.

### ③ Stop button

When this button is pressed, the arm lifter lifts and then, after a few moments, the lamp in either the "33" or "45" buttons turns off. The lamp in the stop button will then light and the platter will stop.

#### NOTE 1:

The reason why the stop button lamp lights only after a brief delay is as follows. When the stop button is pressed, the arm lifter starts lifting immediately. However, since there is a small gap between the arm lifter and the arm tube, a time lag exists until the stylus leaves the disc. This record player is designed so that normal speed is maintained

#### NOTE 2:

If the start button is pressed right after the stop button is pressed, the lamp in the stop button may light and the platter will stop. Therefore, when changing speed during rotation, it is advisable to press the start button of either "33" or "45" directly without pressing the stop button.

### ④ Strobe viewing window

When the platter is rotating at a specified speed, the strobe pattern observed through this window should appear to be standing still.

### ⑤ Lifter button

Each time this button is pressed, the arm lifter moves up and down.

### ⑥ Cueing lamp

This lamp lights while the arm lifter is down.

### ⑦ Counterweight

Turning this weight adjusts the tracking force.

### ⑧ Anti-skating knob

By adjusting this knob, a force is applied towards the outside of the disc at the stylus tip.

## ADJUSTMENT

### 1. Adjustment of spacing between detection head and platter:

Adjust the spacing so that it may represent abt. 0.15 mm between the magnet-coated surface of platter and detection head. Depending upon the degree of the spacing, the condition of stop will vary. Consequently, adjustment should be made in such a way that the platter without the turntable sheet on glides slightly forward when stopping.

#### NOTE:

When the magnetic head is replaced, make sure that the terminal connection is as shown in the figure below. Otherwise, the platter may turn reversely.

### 2. Confirming the regulator voltage:

Since the power source employs a fixed voltage 3-terminal IC, confirm that the output voltage of IC5 and represents  $5V \pm 0.2V$ . (No adjustment is feasible.)

### 3. RPM Adjustment:

- (1) Pull out the lead wire through test points 39 and 41 (3P connecting pin) on motor servo P.C. Board KU-385 and connect 39 to positive side of the oscilloscope while 41, earth side.
- (2) Adjust the speed to 45 RPM; observing the waveform by means of an oscilloscope, Adjust VR2 so that the pulse may occur at the 40% position from the left of the pulse side of the half-cycle in a cycle of a square wave as shown in the figures below.
- (3) Subsequently adjust VR1 for 33 RPM in the same manner as in the case of 45 RPM so that the pulse may be positioned at 40% of the square wave cycle.

(Reference)

Following are the waveforms of test points 39—40 and 41—40: (Test Point 40 is ground.)

### 4. Arm lifter height adjustment:

Arm lifter is so designed as to move upward and downward together with the arm when its height is adjusted. Although the adjustment is carried out in the plant before shipment, if re-adjustment is required, the height can be re-adjusted in the following manner:

- (1) Loosen the arm lifter height adjusting screws. Depress lifter button to light the cueing lamp and lower the arm lifter.
- (2) Place the stylus point on the record surface and adjust the clearance between the arm lifter and arm tube to be 0.5~1.0 mm by moving the arm lifter vertically, and then tighten the height adjusting screw.

### 5. End adjustment (lead-out adjustment):

The end adjustment has been carried out in the plant prior to shipment with respect to the straight arm tube. If, however, re-adjustment is required, adjust in the following manner:

- (1) Turn the anti-skating knob to '0'.
- (2) Confirm that the cueing lamp is off. If it is lit, depress the lifter button so that the arm lifter is kept up.
- (3) Set the cartridge stylus point to position 53 mm from the motor shaft by the use of accessory overhang gauge.
- (4) Turn the lead-out adjusting screw with a screw-driver so as to allow the lead-out adjusting indicator to light.

### NOTE 1.

If the auto-lift operates normally, there is no necessity for re-adjustment even if the lead-out adjusting indicator fails to light when the stylus point is set in a 53 mm position from the motor shaft.

### NOTE 2.

Although the lead-out adjusting indicator may light on or off immediately before the end of the 17 cm disc performance, there is no drawback as regards the mechanical performance since the stylus point has approached the 53mm area.

## TO CHANGE THE OPERATIONAL VOLTAGES

### A. Model whose voltage selector is accessible by the user: (Multi-voltage model)

This equipment has been preset for a line voltage of 220V. Before inserting the power plug, please check if this voltage corresponds with the line voltage in your area. If it does not, be sure to adjust the voltage selector switch to the proper setting before operating this equipment. The voltage selector switch is located on the base surface below the turntable platter. Simply insert a screw driver into the voltage selector switch and turn it in either direction so that the desired voltage marked on the switch is positioned in the window.

Damage of equipment because of missetting of voltage selector is not within the limit of **DENON** liability.

### 6. Offset Adjustment:

(Adjust when IC1 (KU-356) is replaced.)

- (1) Make a short circuit between the both ends of R46 of arm servo P.C. board KU-356, between TR6 base and earth, and between TR9 base and earth.
- (2) Adjust VR1 so that the d.c. voltage at terminal 14 of IC1 may represent  $1.4 \pm 0.1V$ .

Set the voltage selector in accordance with the nominal power supply voltage as shown in the table.

ACTUAL (nominal) VOLTAGE (volt)	VOLTAGE SETTING
110 115 120	120
200	200
210 220	220
230 240	240

### B. Models whose voltage selector is not accessible by the user: (Australian, UK and Canadian models)

#### 1 Australian and UK models

Although these models are provided with the voltage selector being preset to 240V, it cannot be operated by the user since it is blinded by the shield cover. However, in case the change of voltage setting is necessary, insert a screw driver into the voltage selector and turn it in either direction so that the desired voltage indicated on the selector is positioned at the cut-out marking as shown in figure below.

#### 2 Canadian model

Although this model is provided with the voltage selector being preset to 120V, it cannot be operated by the user since it is blinded by the shield cover. Since the Canadian model must comply with the CSA standards, the components directly connected to the power line are CSA recognized having 125VAC rating. Therefore, DO NOT change the voltage setting.

For a smooth function of the automatic arm lift of this model, a special grease (SILICONE GREASE G-31) is applied at the lifter shaft/cylinder bearing.

In case of servicing this part, re-apply the SILICONE GREASE G-31 after cleaning the lifter shaft and inside of the cylinder.

After assembly, move the lifter shaft up and down until the movement thereof becomes smooth. Then make sure the lifter shaft falls by its own weight.

**WARNING:** Shaded parts are important to SAFETY. Replace always with same type, same rating.

# DENON

## MAIN SPECIFICATIONS

### ● Phono motor

**Drive system:** Direct drive AC motor  
**Speeds:** 33-1/3 rpm, 45 rpm.  
**Wow and flutter:** 0.015% wrms (see note)  
**S/N:** More than 78dB (DIN-B)  
**Rise time:** Less than 2.0 sec. (33-1/3 rpm)  
**Platter:** Diecast aluminum 300 mm diam Moment of inertia, 200 kg-cm<sup>2</sup> (0.2Nm<sup>2</sup>) Including turntable mat  
**Motor:** AC servo motor  
**Speed control system:** Speed servo control by frequency detection system combined with phase control system with reference to quartz crystal oscillator.  
**Load influence:** 0% at out-most groove with stylus force of 100 g (0.98 N)  
**Speed deviation:** Less than 0.002%  
**Brake system:** Electronic brake

### NOTE:

Measured by DENON's method using magnetic pulse wheel.

### ● General

**Power supply:** Rated voltage and frequency are shown on the rating label at the back of cabinet and/or on the label attached to the power supply cord.  
**Power consumption:** Approx. 18 W  
**Dimensions:** 485Wx180Hx410D mm (Dust cover closed)  
**Weight:** Approx. 13 kg

\* All specifications and outward appearance are subject to alteration for improvement without notice.

### ● Tonearm

**Type:** Static balance type with vibration damping (Replaceable tonearm tube)  
**Effective length:** 244 mm  
**Overhang:** 14 mm  
**Tracking error:** Less than 2.5°  
**Tracking force range:** 0~2.5g/rot. (1 division is 0.1g)  
0~25mN/rot. (1 division is 1mN)  
**Acceptable weight of cartridge:** Approx. 4g to 10g (Including screws and nuts when mounted on straight arm tube)  
Approx. 12g to 18g (Including head shell, screws and nuts when mounted on S-shaped tonearm tube)  
**Head shell connector:** Standard type 4P (On S-shaped tonearm tube)  
**Arm height adj. range:** Approx. 5mm  
**Output cord:** Low capacitance cord  
**Facilities provided:** Anti-skating device and Automatic arm lift mechanism  
**Tonearm lifter:** Servo-controlled by angular control motor

### Change the rated frequency

The DP-60L can be used compatibly on power supply frequencies of 50Hz and 60Hz.
