EXPLANATION OF OPERATION

(1) PLAY

When the "PLAY" button is pushed, both the SCR1 and SCR2 are turned "ON".

(a) The sub-motor starts rotating when the SCR2 is switched on, which makes the main gear rotate and the gear switch on. Therefore even if the play switch is turned off, the sub-motor keeps rotating and operating until the gear switch is turned off after one rotation.

By the rotation of sub-motor, the rotation plate is pressed to the delivering arm, and at the same time, the delivering arm starts rotating, which, in case that the tone arm is out of the arm-rest, gets the tone arm returned to the arm-rest side in the former half of rotation, then gets it conveyed to the lead-in position of the LP or EP record in the latter half of rotation. The gear switch is turned off when the gear gets one rotation, and the rotation plate gets away from the delivering arm, and the tone arm gets free for operation and keeps on playing.

(b) When the SCR1 is turned on, the solenoid starts rotating according to the selection at speed selector, LP (33rpm) or EP (45rpm).

At the LP position, the rotating angle of the selector gets the bigger one, and the rotation of the delivering arm stops at the lead-in position of the LP, while at the EP position, the rotating angle of the selector gets the smaller one, and the rotation of the delivering arm stops at the lead-in position of EP.

When the gear starts rotating by the rotation of sub-motor, the gear switch is switched from NC side to No side, which makes the motor circuit opened between the terminal 18 and 20, and the main motor starts rotating.

(2) AUTO PLAY

When the stylus of cartridge comes to the end of the disc grooves after the playing, the delivering arm moves rapidly between the L.E.D. and photo transistor.

When the voltage at the input terminal 3 in the operation amp. exceeds the voltage at the input terminal 2, the output of operation amp. turns to be (+), and only the SCR2 works, which makes the sub-motor get one rotation.

The pick-up arm is returned to the arm-rest in the former half of rotation of the main gear.

As the solenoid does not rotate, the selector stops at the angle corner of the rotation plate, which does not make the rotation plate rotate and the pick-up arm stops at the arm-rest.

When the pick-up arm gets back to the arm-rest, the rest switch is turned on, and the gear switch is switched to NC side, which makes the motor circuit shorted between the terminal 18 and 20 and the main motor stops finally.

(3) REPEAT PLAY

Like the AUTO PLAY mode, the SCR2 turns on, which makes the sub-motor get one rotation.

The pick-up arm is returned to the arm-rest in the former half of rotation of the main gear.

At the same time, the SCR1 also turns on and the solenoid rotates either to the LP or EP side depending ON speed selector just as the case that PLAY switch is turned on.

The delivering arm rotates till the lead-in position of LP or EP, and repeat playing.

(4) CUT

When the cut button is pushed in, only the SCR1 works, and the solenoid does not rotate. Only the sub-motor rotates, the pick-up arm gets back to the arm-rest, and the main motor stops rotating upon its return at the AUTO mode.

(5) PU arm up-down operation

When the lifter lever gets down, the main gear stops, and the lifter cam-plate goes down, and the pick-up arm is kept in the down status, while the main gear rotates, the lifter cam-plate is lifted up by the main gear, and the pick-up arm is kept in the up status

ALIGNMENT PROCEDURE

(1) Adjustment of sensor voltage

Adjust the voltage at the test pin 10 and 12 in the control circuit as stated hereunder.

	collector voltage photo transistor	voltage at operation amp. input terminal 2
setting value	0.2V	0.5V
adjustment part	VR1	VR2
test pins measured	9 . . . 10	9 . . . 12
measuring condition	confirm the delivering arm does not cover the space between LED and photo transistor	confirm the speed selector is put at LP
Remarks		

(2) Adjustment of lead-in position

Set the mode at AUTO, and push on the PLAY button, then adjust the eccentric pin(1) so that the stylus position can be put in the right position. (Refer to fig. 1.)

The test record, NEC ES1008 or the equivalent shall be used.

Fig. 1.

AUTO-IN POSITION		
	LP	EP
Specification test record count	296.2φ ... 293.2φ 7 ... 22	171.85φ ... 168.4φ 12 ... 29
Target spec of adjustment test record count	294.7φ 14.5	170.125φ 20

(3) Adjustment of return position

Set the mode in AUTO, and adjust the eccentric pin (2) so that the position from the center of platter to the stylus can be put in the following range.

AUTO RETURN POSITION	
Specification test record count	115.6φ ... 105.6φ 18 ... 23
Target spec of adjustment test record count	109.8φ 21

(4) Height adjustment of elevation plate

This adjustment shall be made by the EL nut.

The elevation plate goes down by clockwise turn of EL nut, while going up by counter clockwise turn.

(5) Adjustment of rotation

Set the speed adjustment knob at the mechanical center position for both 33 and 45 r.p.m. respectively, and adjust the VR1 (33 r.p.m.) and VR2 (45 r.p.m.) in the motor control P.C.B. so that the stroboscope gets stationary.

(6) Wow & Flutter adjustment

Adopting the test record for wow & flutter measurement, adjust the semi-fixed resistors VR3, VR4 and VR5 in the motor control P.C.B..

As to the adjustment of wow & flutter, the wow meter is absolutely necessary.

The optimum adjustment is made at our factory and please refrain from readjustment as much as possible, since the well-practiced technique is required.

(7) The distance between delivering arm and the friction rubber at the rotation plate.

Adjust the space between the delivering and the friction rubber at the rotation plate, which is mounted to pick-up arm, to around 1.5... 2.0mm at the position of main gear.

Check if the friction rubber is not damaged and it is inserted rightly, and also confirm if no oil adheres to rotation plate and friction rubber.

Among the good having the serial number up to 1500, when you found it difficult to get the pick-up arm back to arm-rest completely at return mode even after the adjustment as above mentioned, the rotation plate has to be replaced from original 896250-1 (with red mark, length; 26mm) to 896250-2 (with blue mark, length; 26.5mm).

(8) The selector solenoid shall be checked if the switching operation between LP and EP is found OK under DC 12V power supply.

Also when the power is switched off, the part carved for LP and EP selection shall be put back to the range to where the select arm goes down.

Check if such metallic materials as screw or washer does not stick to the magnet of solenoid.

(9) When the power supply having DC 5V is applied to the sub-motor (lead wire; red \oplus , white \ominus) the rotation plate, select arm and switch arm shall follow each cam surface and shall be operated without such noise as follows:-

- (a) The rattling noise caused by the something attached to gear or damaged gear.
- (b) The creaking and droning noise caused by the deep gearing.
- (c) The gear noise by the shallow gearing.

The allowance of main gear for up-down ward: 0.1 0.7 mm

The allowance of select arm for up-down ward: 0.05 0.5 mm

The allowance of R solenoid (select cam) for up-down ward: 0.2 0.8 mm

The allowance of switch arm for up-down ward: 0.1 0.7 mm

Sub-motor: DC 5V 50mA, 180mA when locked.

(10) Lubrication

The lubrication shall be made by FLOIL G.P.670 grease made by KANTO chemical or the equivalent.

The portions to be lubricated:

- (a) The axes:
 - 1. the axe of main gear
 - 2. the bearing for up and down operation of 2 stage gear.
 - 3. the axe of select arm
 - 4. the axe of rotation plate.

Caution: The lubrication is not allowed to the axe of switch arm and the select cam axe of R solenoid.

- (b) The gear:
 - 1. all peripheral contour of the warm gear.
 - 2. all peripheral contour of the large and small flat gear.
 - 3. all peripheral contour of the cam surface.

- (c) The lubrication is not necessary to the main motor due to its special construction.

SPECIFICATIONS

[Phono Motor Section]

*Driving System:	Direct-Drive System
*Motor:	DC-servo brushless & slotless motor
*Turntable Platter:	30 cm aluminium die-cast (weight 1.8 kgs including platter-mat)
*Rotation:	33-1/3 rpm, 45 rpm (2-speed)
*Adjustable Range of Rotation:	±4%
*S/N Ratio:	better than 60dB (IEC-B)
*Wow & Flutter:	no more than 0.03% W.R.M.S.

[Tonearm Section]

*Tonearm:	Straight Arm of static balance type
*Effective Length:	240 mm
*Tracking Error:	+2°13', -1°08'
*Overhang:	15 mm
*Cartridge Weight:	4g – 11g
*Cartridge Height:	16mm ~ 19mm (by use of spacers)
