

ONKYO. SERVICE MANUAL

QUARTZ SINGLE-PLAY FULLY AUTOMATIC TURNTABLE

Model CP-1030F

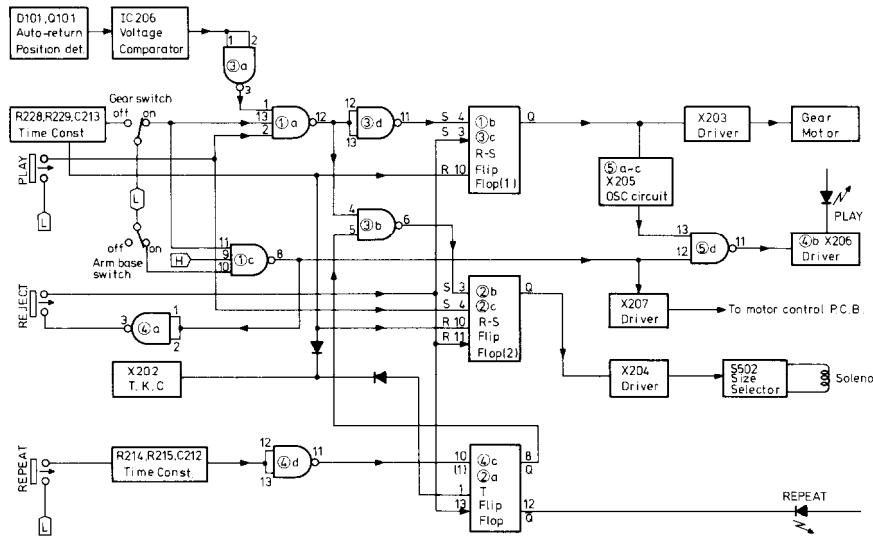

SPECIFICATIONS

Type:	2-speed fully-automatic turntable with cueing lever	Usable Cartridge Weight:	Min. 5.0 g, Max. 8.5 g
Turntable Platter:	31 cm (12-3/16") Aluminum diecast	Power Supply Rating:	AC 110-120, 220-240V, 50/60 Hz (or 240V 50Hz, 120V 60Hz, only)
Motor:	Brushless, coreless, slotless, DC Quartz Direct Drive	Power Consumption:	6 watts
Speeds:	33-1/3 rpm, 45 rpm	Dimensions (W x D x H):	453mm x 370mm x 133mm
Wow & Flutter:	0.03% WRMS	Weight:	17-7/8" x 14-1/2" x 5-1/4"
Signal-to-Noise Ratio:	75 dB (DIN B)	Cabinet Composition	6.5 kg (14.3 lbs.)
Tonearm:	Static balanced straight pipe	Turntable Board:	Polystyrene
Effective Arm Length:	224mm (8-13/16")	Bottom Board:	Fiber Reinforced
Overhang:	13mm (1/2")	Dust Cover:	Polyethylene
Maximum Tracking Error:	+3 degrees, -1 degree		Polystyrene

In the interest of further product improvements specifications are subject to change without notice.

BLOCK DIAGRAM

Notes: S: Set input of flip-flop
R: Reset input of flip-flop
Q, \bar{Q} : Output of flip-flop
L: Low level ($-12V$)

Service Technology (Part 1)

- Note 1. Refer to the circuit diagram and block diagram.
 2. "L" and "H" denote TTL positive logic, while the figures in circles denote IC pin terminal numbers and printed circuit board terminal numbers.
 3. FF denotes flip-flop.

Play operation

- When IC1a (2) is dropped to "L" level, IC1a (12) is switched over to "H" and IC1b (6) is switched to "H" to turn X203 on, the main gear drive motor is started.
- When IC2b (4) is dropped to "L" level and IC2b (6) switched to "H" level to turn X204 on, the record size selector solenoid is activated.
- When the main gear drive motor is started, the main gear is rotated and SW7 gear switch is turned on.
- When the main gear switch is turned on, IC1c (11) is switched over to "L" and IC1c (8) is switched to "H" to turn X207 on, the turntable platter drive motor is started.
- When the main gear is rotated, the tonearm is operated and the tonearm switch is turned on.
- When the IC5a (1) input of oscillator circuit is switched "H" level, its circuit is operated, thereby the play indicator repeat turns on and off.
- When the rotation of main gear is finished, the gear switch restores R-F flip-flops to the initial condition and the play indicator is turned on.

Reject Operation

- When IC1b (3) is dropped to "L" level and IC1b (6) switched to "H" to turn X203 on, the main gear drive motor is again started up.
- When IC2c (10) is dropped to "L" level, IC2c (8) is switched to "H" and IC2b (6) to "L" to cut X204 off, thereby inhibiting the record size selector solenoid.

Repeat Operation

- When IC4c (10) is dropped to "L" level, IC4c (8) is switched to "H" and IC3b (5) kept at "H". When IC2a (1) is switched to "H" level, IC2a (12) is dropped to "L" to turn the repeat indicator L.E.D. on. When the tonearm returns automatically at the end of the record, IC206 (6) generates an H pulse ($\int \int L$) which is then inverted by IC3d to become an L pulse. When this

pulse is applied to IC1a (1), resulting in IC1a (12) being switched to "H" level. Thereby when IC3b (6) switched "L" level, IC2b (6) switch to "H" to turn X204 on and activate the record size selector solenoid.

To release the repeat mode, simply press the REJECT key. In this case, IC2a(13) is dropped to "L" level, IC2a (12) switched to "H" and IC4c(8) to "L", followed by IC3b(5) being switched to "L" and IC3b(6) to "H". Then in conjunction with the reject operation described above, the repeat mode is released by reject action. In other words, the repeat mode is maintained only as long as IC3b(5) is kept at "H" level.

Restoration of Initial Condition

When the main gear drive motor is started up for play or reject operations, the main gear is also rotated. SW7 coupled to the main gear restores two R-S flip-flops initial condition.

Auto-Return

When an eccentric pin of the lead arm coupled to the tone-arm is inserted between D601 and Q601, it serves as a shut-off mechanism which turns the Q601 phototransistor off. The difference in voltage is applied to a comparator via IC206 (3), resulting in the generation of a positive pulse which serves as the comparator output appearing at IC206 (6). This pulse is subjected to rectification and inversion at the CR and IC3a, thereby forming a negative pulse which is applied to IC1a(1). This is then followed by return or repeat operation in the same way as described above.

Manual Play

When the tonearm is raised from the arm reset by hand, the tone arm switch drops IC1c(10) to "L" level, resulting in IC1c(8) being switched to "H" to turn X207 on, thereby starting up the turntable motor by turn on of X207.

Stopping the Turntable Motor

- When the tonearm is returned manually to the arm rest IC1c(10) is switched instantaneously to "H" level and IC1c(8) to "L", thereby turning X207 off to bring the turntable motor to a stop.
- When the main gear starts to rotate during reject or auto-return mode, the SW7 gear switch is set to "on" position during rotation, and to "off" position end the end of one revolution. As soon as this single revolution is completed, IC1c(11) is switched to "H" level.

SERVICE PROCEDURES AND ADJUSTMENTS

1. Voltage Conversion

This turntable may be set to operate at either 110V – 120V or 220V – 240V at 50Hz to 60Hz. The voltage selector switch is under the turntable. If a voltage change is necessary, remove the lock plate, switch to the proper voltage, and replace the plate.

CAUTION: DISCONNECT POWER SUPPLY CORD FROM AC OUTLET BEFORE CONVERTING VOLTAGE.

2. DD Motor Control Circuit Adjustment

1) Voltage adjustment

*Connect the DC voltmeter between 26 and ground terminals on the motor control p.c.b.

*Adjust VR304 to 12V reading.

2) Time base adjustment

*Connect the dual-image oscilloscope between terminal No. 14 and ground and terminal No. 16 and ground in the motor control p.c.b.

A=12.5msec. (33 rpm) (VR305) $\frac{1}{2}$ msec

A=10.0msec. (45 rpm) $\frac{9}{4}$ msec

3. Wow and Flutter adjustment

Play the 3kHz test record, and adjust VR301 – VR303 so as reduce wow and flutter to a minimum.

4. Return Position Adjustment

Connect a DC voltmeter between pins 9 and 10 of the control circuit board, and adjust VR-201 so that the voltage lies within the 0.2 ± 0.05 V range.

Set the speed selector to 33 rpm, and reconnect the voltmeter to pins 9 and 11. Adjust VR-202 to obtain a reading of 0.8 ± 0.05 V.

Then adjust the return position by the large eccentric pin attached to the tonearm base.

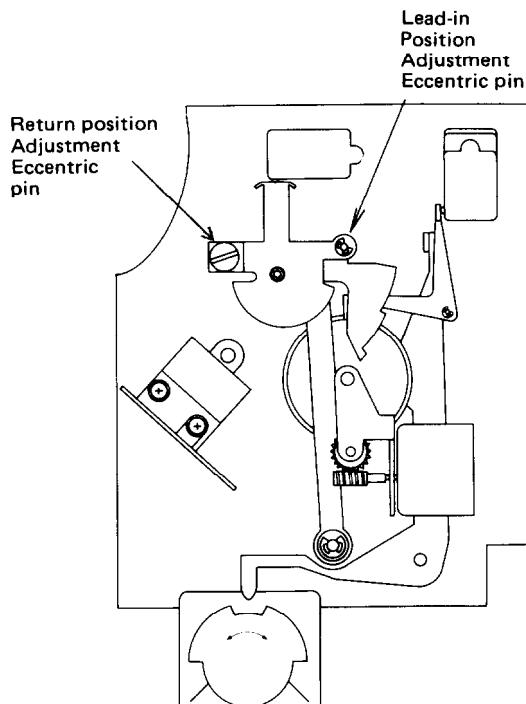

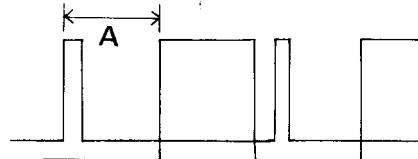

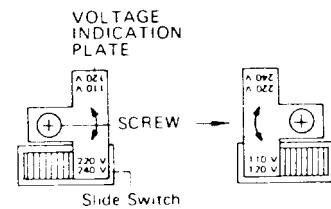

5. Lead-In Position Adjustment

The lead-in position is adjusted by means of the small eccentric pin attached to the base of the tonearm.

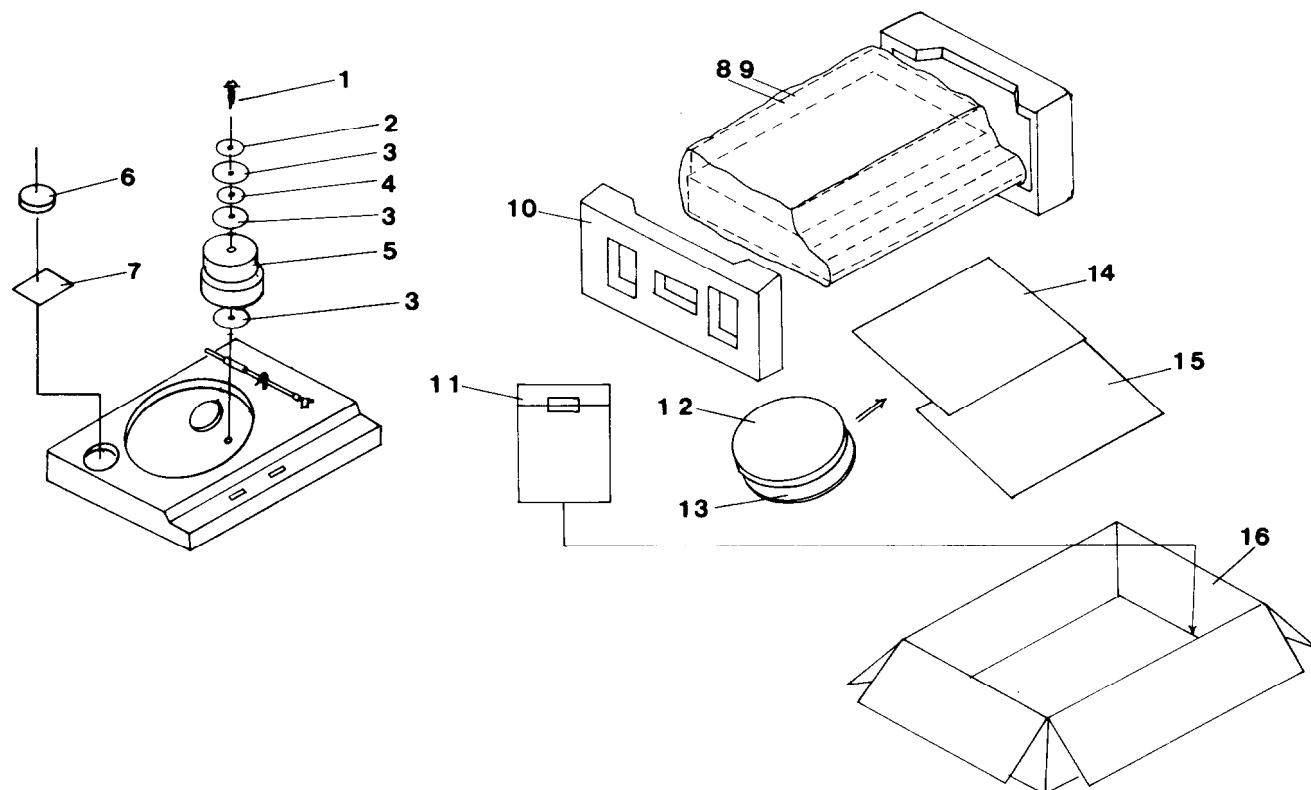

The arm switch is at "off" position (on the arm rest) at this time, and IC1c(10) is at "H" level. At the instant that IC1c(8) is switched to "L", resulting in X207 being cut off to stop the turntable motor.

Power On Reset

When the power switch is turned on, three FFs at X202 time constant circuit are reset to their prescribed initial state.

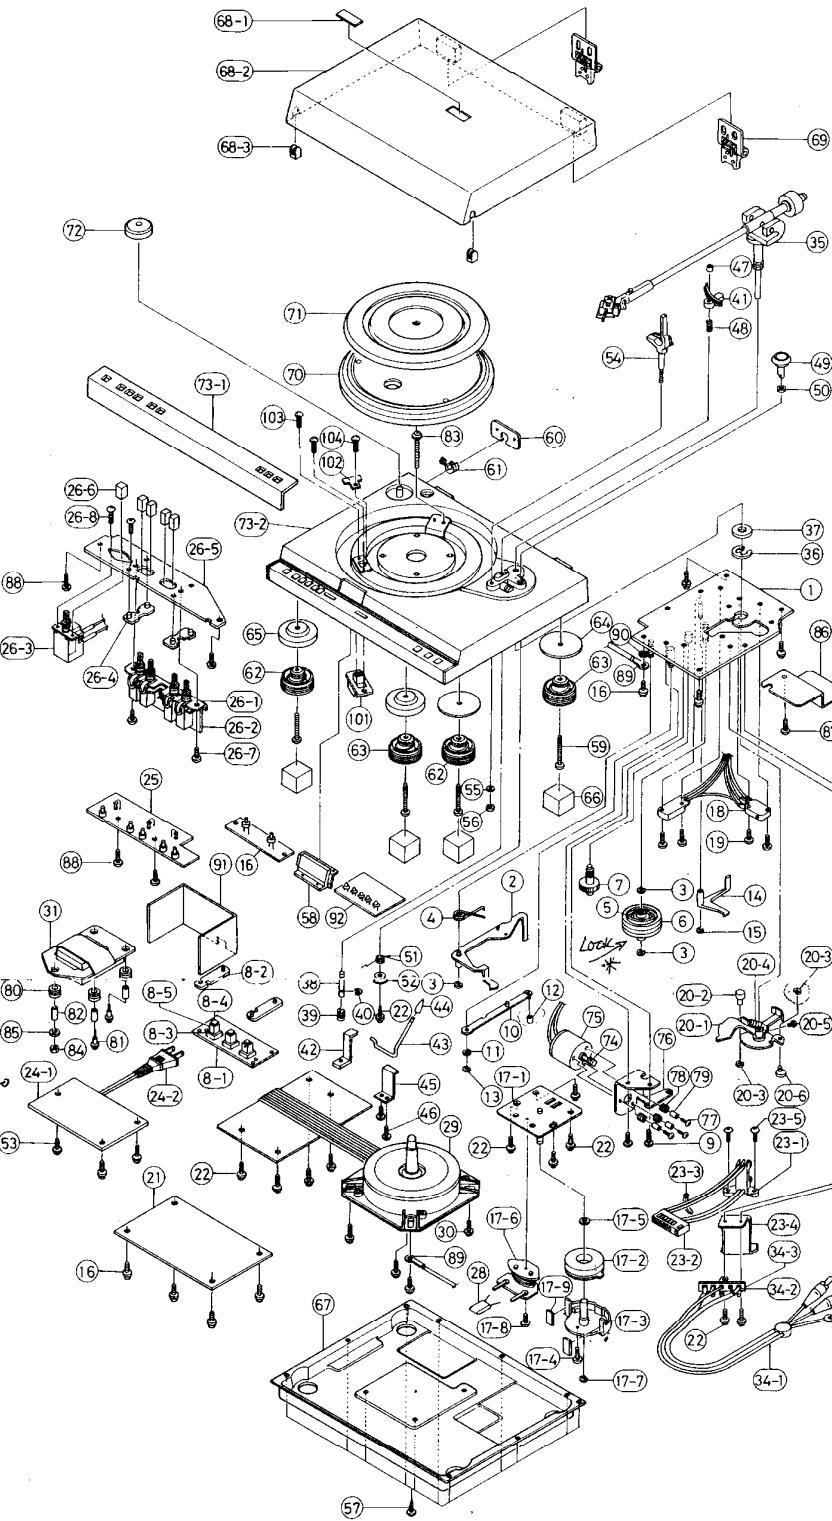

PACKING PROCEDURES

REF. NO.	PARTS NO.	DESCRIPTION
1	24059147	FMT \pm 4 x 30, Screw

(UD): Only 120V model

**Turntable “Flattens”
Warps**

Onkyo's new CP-1030F turntable is a single-play, fully automatic, direct-drive model with a quartz-lock speed control and a specially designed low-mass carbon-fiber

tonearm said to give optimum results with today's high-compliance cartridges. Low-frequency resonance of the arm and a typical high-compliance cartridge is controlled well enough, according to Onkyo, to allow warped records to be played with a minimum of distortion. In addition, the turntable has a rated signal-to-noise ratio of 75 dB and wow and flutter less than 0.03% (WRMS). Reliability of the unit is said to be enhanced by the use of an additional motor dedicated to tonearm functions. A set of LED indicators show what functions are engaged. \$315.
