Stereo Integrated Amplifier

## SU-7300

(XA), (XAL), (XG), (XGH),  
(XGF), (XSD), (XSW), (XE)

The cabinet color shall be subject to change dependent on the destination.

The model SU-7300 [XA] is available in Asia,  
Latin America, Middle East and Africa.  
The model SU-7300 [XAL] is available in Australia only.  
The model SU-7300 [XG] is available in European only.  
The model SU-7300 [XGH] is available Holland only.  
The model SU-7300 [XSD] is available in Scandinavia only.  
The model SU-7300 [XSW] is available in Switzerland only.  
The model SU-7300 [XE] is available in England only.  
The model SU-7300 [XGF] is available in France only.

### TECHNICAL SPECIFICATIONS (IHF)

Specifications are subject to change without notice for further improvement.

#### AMPLIFIER SECTION

## ■ LOCATION OF CONTROLS

- This photo shows only the products for [XA].
- The products for other destinations except [XA] are equipped with AC outlets.
- For further remark, the products for [XAL] are not provided with voltage selector and AC outlets.

## ■ TO REMOVE CABINET

1. Remove four (4) cabinet-mounting screws, nos.①~④ as shown in Fig. 1.
2. Remove cabinet from chassis in arrow direction 1 to 2, as shown in Fig. 1:
3. To reassemble, reverse above procedure.

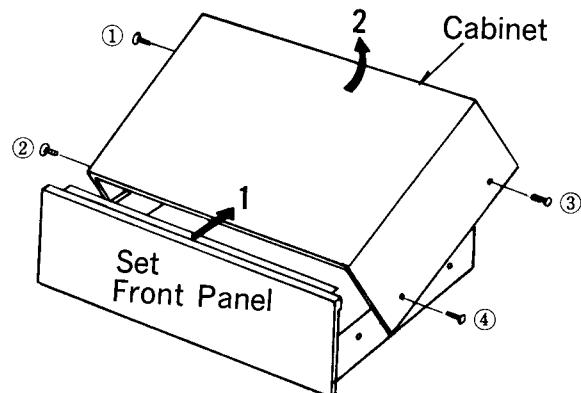

Fig. 1

## ■ TO REMOVE CHASSIS

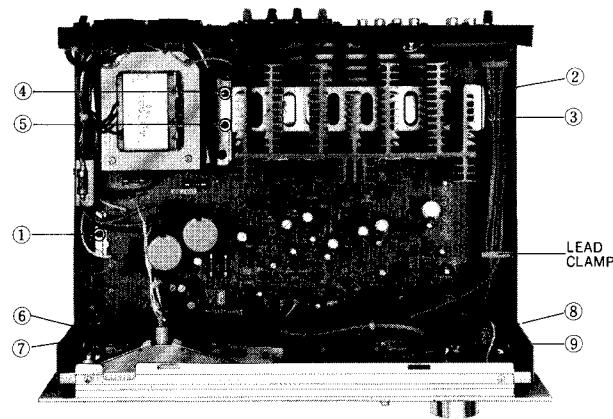

Fig. 2

4. Remove four (4) heat sink-mounting screws. (Refer to Fig. 2: ②~⑤).
5. Remove four (4) panel-mounting screws from chassis. (Refer to Fig. 2: ⑥~⑨, left and right side).
6. As photo in Fig. 3, hold the panel at its side ends and push it downward tilting slightly its top part to the forward direction.
7. Remove the front panel from the chassis. (Fig. 4 to Fig. 5).
8. Set the printed circuit board on the chassis as indicated in Fig. 6.
9. The front panel can be reset in the reverse sequence.
10. Mount the lever switch bracket inside the chassis prior to resetting the front panel. (Fig. 6).

1. Remove cabinet from chassis. (Refer to "To remove cabinet").
2. Remove lead wires from lead clamp. (Refer to Fig. 2).
3. Remove a screw and printed circuit board metal clamp. (Refer to Fig. 2: ①).

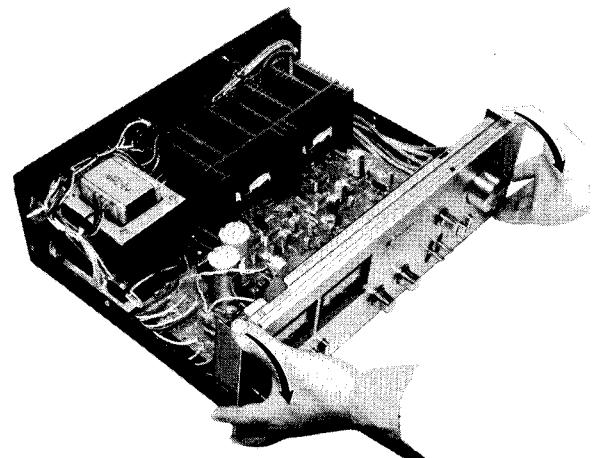

Fig. 3

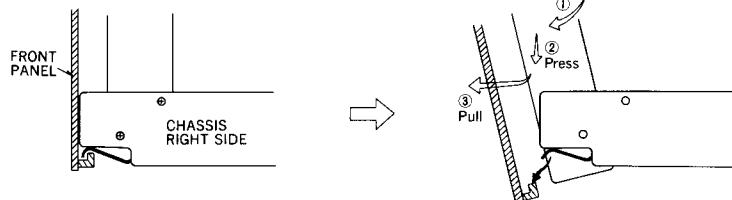

Fig. 4

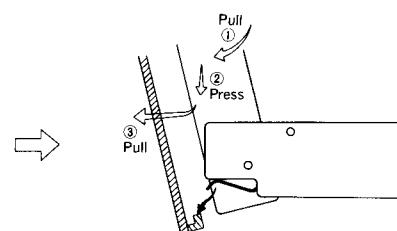

Fig. 5

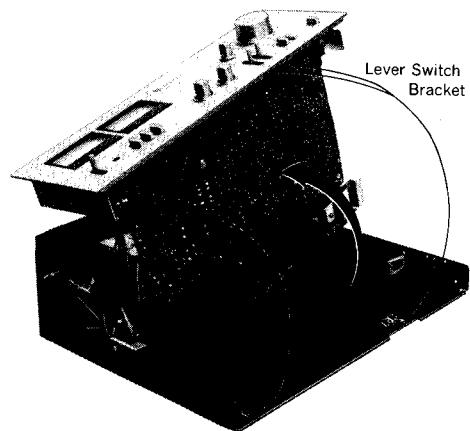

Fig. 6

## ■ NOTE

The unit is provided with the speaker circuit protection fuses at the right and left channels respectively. The fuse is to prevent the power transistor from destruction, should the speaker terminals be short-circuited. Accordingly, if the unit fails to function upon completion of the speaker connections, check the speaker protection fuses first of all for possible blowing.

## ■ ALIGNMENT INSTRUCTIONS

- When the power transistor is replaced, be sure to apply silicone compound (or equivalent thermal diffusion agent) onto the mica plate, and at the same time confirm the idling current of the power transistor. (measure voltage across the emitter resistance)

**(A) For adjustment with DC voltmeter**

- Turn the speaker switch "OFF".
- Connect the DC voltmeter as in Fig. 7 of the adjusting spot diagram.
- If the reading is under 25mV approximately several minutes after turning ON the power supply, the circuit is "OK". On the other hand, if the reading is over 25mV, cut off the lead wire for **L** in the case of left channel (The lead wire for **R** in the case of right channel).
- Should the reading not fall under 25mV even when the lead wire has been cut off, there is something wrong with the circuit, and therefore, check the power source circuit or main amplifier circuit.

NOTE: When cutting off the lead wire, cut off the same at the root.

**(B) Current should be checked only when adjustment is made with a tester. (measuring instrument incapable of measuring voltage in mV unit).**

- Turn OFF the power supply for the set.
- Connect the ammeter as shown in Fig. 9.
- After ensuring that the ammeter will not come off, turn ON the power supply.
- If the reading is under 75mA after several minutes (But, when nothing resistance of internal resistor by ammeter) the circuit is "OK". If over 75mA, cut off the lead wire for **L** in the case of left channel (The lead wire for **R** in the case of right channel).
- If the reading does not fall under 75mA, there is something wrong with the circuit.

NOTE: The adjustment may be made either by **(A)** or by **(B)** method. (We recommend the method **(A)** where possible). Figs. 8 and 9 are related to the case of left channel.

## ■ ABGLEICHANWEISUNGEN

- Wenn der Netztransistor ersetzt wird, ist zu beachten, daß eine Siliziumverbindung (oder ähnliches Thermodiffusionsmittel) auf die Glimmerplatte gegeben wird, und zur gleichen Zeit der Blindstrom des Netztransistors festgestellt wird. (Die Spannung über den Emitterwiderstand messen.)
- A** Zum Justieren mit dem Gleichstrom-Voltmeter
  - Drehen Sie den Lautsprecherschalter auf "OFF".
  - Schließen Sie den Gleichstrom-Voltmeter an, wie in Abb. 7 des Justierpunkte-Diagramms gezeigt.
  - Falls die Anzeige weniger als ca. 25 mV beträgt, so ist die Schaltung in Ordnung. Falls aber die Anzeige mehr als 25 mV beträgt, schneiden Sie den Leitungsdraht für **L** im Palle des linken Kanals weg (oder den Leitungsdraht für **R** im Falle des rechten Kanals).
  - Falls die Anzeige auch nach Unterbrechen des Leitungsdrahtes nicht unter 25 mV fällt, so ist die Schaltung nicht in Ordnung, und die Stromquellschaltung und die Hauptverstärkerschaltung müssen überprüft werden.

ANMERKUNG: Falls das Wegschneiden des Leitungsdrahtes nötig ist, schneiden Sie diesen nahe am Anschlußpunkt weg.
- B** Die Stromstärke sollte nur geprüft werden, wenn die Justierung mit einem Prüfgerät vorgenommen wird. (Mit dem Meßinstrument kann die Spannung nicht in mV gemessen werden.)
  - Schalten Sie die Stromzufuhr zum Gerät aus.
  - Schließen Sie das Ammeter an, wie in Abb. 9 gezeigt.
  - Nachdem Sie sich vergewissert haben, daß das Ammeter solide befestigt ist, schalten Sie die Stromzufuhr ein.
  - Falls die Anzeige einige Minuten nach dem Einschalten weniger als 75 mA beträgt, so ist die Schaltung in Ordnung. Liegt die Anzeige über 75 mA, schneiden Sie den Leitungsdraht für **L** im Falle des linken Kanals weg. (oder den Leitungsdraht für **R** im Falle des rechten Kanals).
  - Falls die Anzeige auch dann nicht unter 75 mA fällt, so ist die Schaltung defekt.

ANMERKUNG: Die Justierung kann entweder nach Methode **A** oder **B** vorgenommen werden. (Wo möglich, empfehlen wir Methode **A**. Die Abbildungen 8 und 9 beziehen sich auf den linken kanal.

## ■ INSTRUCTIONS D'ALIGNEMENT

- Lorsque le transistor de puissance est remplacé, s'assurer d'appliquer le composé de silicium (ou un agent de diffusion thermique équivalent) sur la plaque de mica et confirmer en même temps le courant déwatté du transistor de puissance. (Mesurer la tension à travers la résistance de l'émetteur).

- A** Pour la mise au point avec un voltmètre C.C.
  - Tourner le commutateur de haut-parleur sur "OFF".
  - Connecter le voltmètre C.C. comme dans la Fig. 7 du schéma des endroits de vérification.
  - Si la lecture est approximativement inférieure à 25 mV plusieurs minutes après la mise en marche de l'alimentation, le circuit fonctionne correctement. Par contre, si la lecture est au-delà de 25 mV, couper le fil de jonction pour **L** dans le cas du canal Gauche [**L**] , (le fil de jonction pour **R**, dans le cas du canal Droite [**R**]).
  - Si la lecture ne descend pas au-dessous de 25 mV même lorsque le fil de jonction a été coupé, cela signifie qu'il y a quelque chose d'incorrect dans le circuit et par conséquent, il sera nécessaire de vérifier le circuit d'alimentation ou le circuit d'amplification principal.

REMARQUE: Lorsqu'on coupe le fil de jonction, le couper à l'extrémité de sa racine.

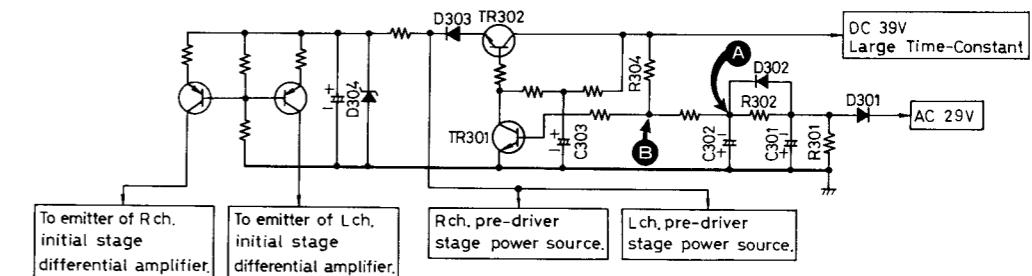

- B** Le courant ne devra être vérifié seulement que lorsque la mise au point est faite avec un appareil contrôleur. (Appareil de mesure incapable d'une tension de mesure dans un appareillage de mV).
  - Couper l'alimentation de l'appareillage.
  - Brancher l'ampèremètre, comme il est montré à la Fig. 9.
  - Après s'être assuré que l'ampèremètre n'est pas débranché, mettre en marche l'alimentation.
  - Si la lecture est inférieure à 75 mA après plusieurs minutes, le circuit fonctionne correctement. Si par contre la lecture va au-delà de 75 mA, couper le fil de jonction pour **L** dans le cas du canal Gauche [**L**] , (le fil de jonction pour **R**, dans le cas du canal Droite [**R**]).
  - Si la lecture ne descend pas au-dessous de 75 mA, cela signifie qu'il y a quelque chose de défectueux dans le circuit.

REMARQUE: La mise au point doit être faite soit avec la méthode **A** , soit avec la méthode **B** . (Si c'est possible, nous recommandons la méthode **A** . Les Figures 8 et 9 se rapportent au cas du canal Gauche [**L**].

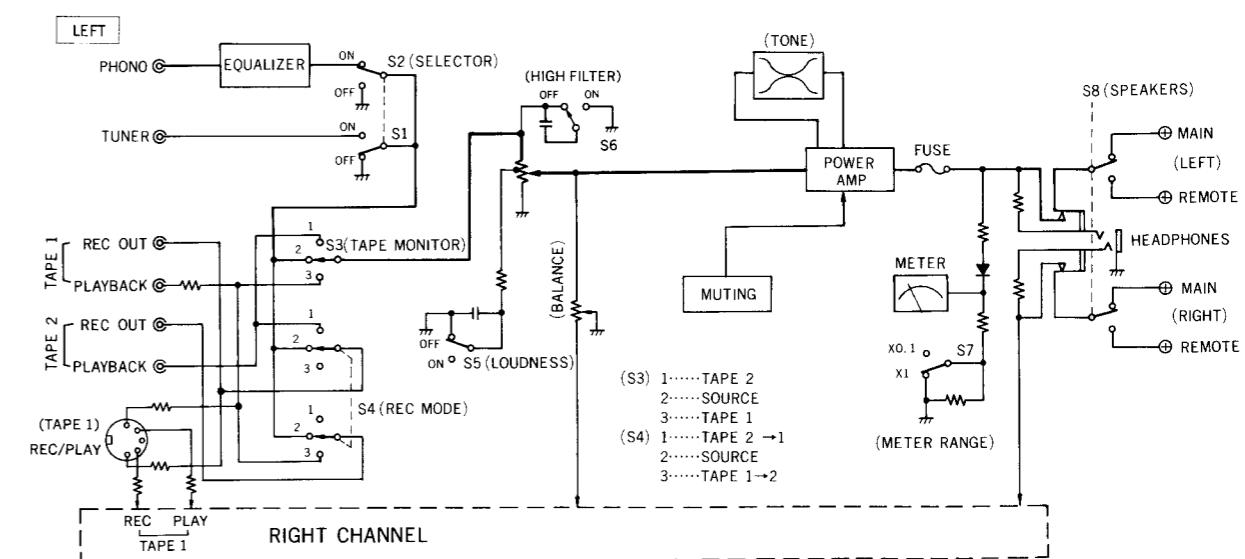

## ■ SERVICE AID

### Shock noise prevention circuit during ON-OFF of power supply

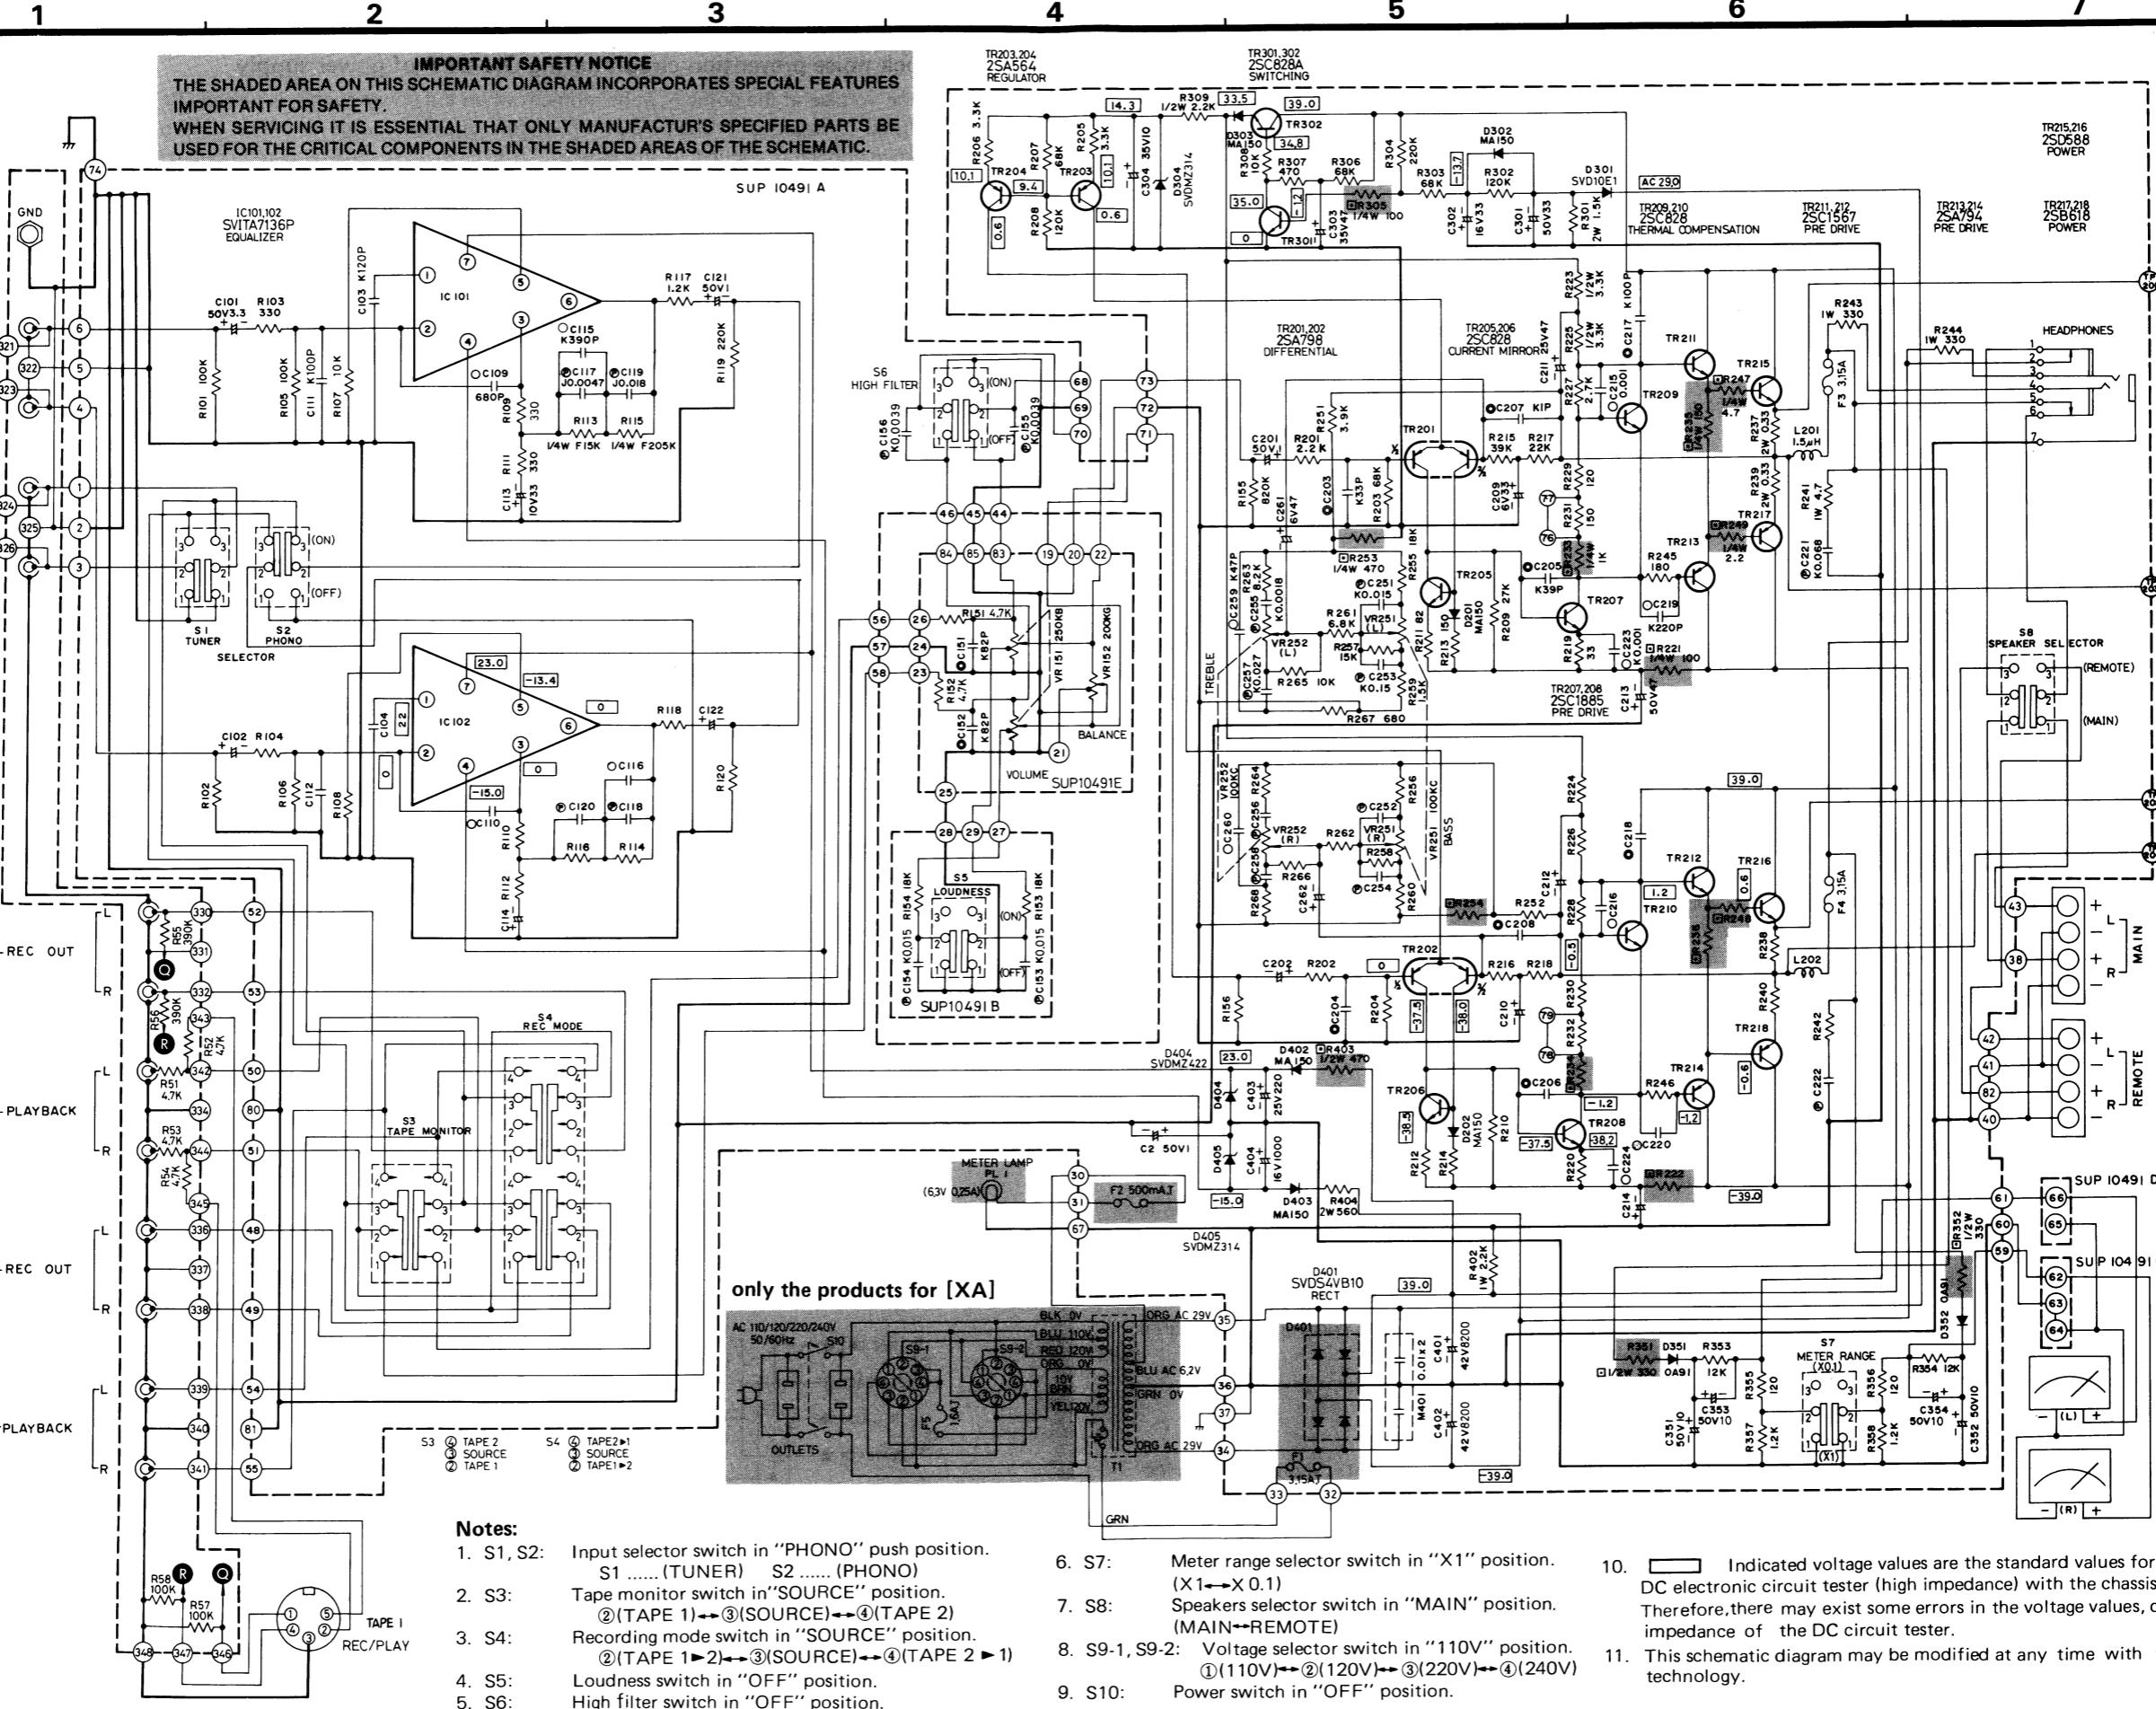

In the voltage at the point **A**, at the moment when the power supply is turned ON, C302 is charged by the current rectified to negative through D301. Therefore, gradual change to minus takes place from 0V. During this time, positive voltage is applied to the base of TR301 which is thus rendered conductive. Consequently, the base of TR302 connected to TR301 is of ground potential, with TR302 not being functioning. In other words, no current is flowing through the preamplifier in this state. After the power supply is turned ON, the potential at the point **B** gradually decreases as the point **A** is saturated to negative through time constant of R302 and C302, and when TR301 reaches cut-off state, positive voltage goes on charging C303. Upon rising of the base potential of TR302 close to 0.7V, TR302 is turned ON, thus causing current to flow through the preamplifier. Time required from turning ON of the power supply to functioning of the preamplifier is set to be approximately 6 to 7 seconds. When the power supply is turned OFF, D302 is biased in the forward direction, and if R301 < R302, the charges in C301 and C302 are discharged through R301 in a short period of time. However, large positive voltage of specific constant does not fall immediately, with voltage at the point **B** rising up to TR301 operating voltage for causing TR301 to function. Accordingly, the charge in C303 is discharged, and TR302 rapidly reaches cut-off state, with current being prevented from flowing through the preamplifier, so that the shock noises from the preamplifier section during turning OFF of the power supply can be eliminated.
